1. Introduction

<u>Typst</u> is typesetting framework aiming to become the next generation alternative to LATEX. It excels in its friendly user experience and performance.

The physica package provides handy Typst typesetting functions that make academic writing for natural sciences simpler and faster, by simplifying otherwise very complex and repetitive expressions in the domain of natural sciences.

This manual itself was generated using the Typst CLI and the physica package, so hopefully this document is able to provide you with a sufficiently self evident demonstration of how this package shall be used.

2. Using physica

With typst's package management:

3. The symbols

Some symbols are already provided as a Typst built-in. They are listed here just for completeness with annotation like ^{typst} this, as users coming from LATEX might not know they are already available in Typst out of box.

All symbols need to be used in **math mode** \$...\$.

3.1. Braces

Symbol	Abbr.	Example	Notes
typst abs (content)		$\mathrm{abs}(\mathrm{phi}(\mathrm{x})) \to \varphi(x) $	absolute
typst norm (content)		$\mathrm{norm}(\mathrm{phi}(\mathbf{x})) \to \ \varphi(x)\ $	norm
order(content)		$\mathrm{order}(\mathbf{x}^{\mathbf{\hat{2}}}) \to \mathcal{O}(x^2)$	order of magnitude
Set(content)		$\begin{split} & \operatorname{Set}(\mathbf{a}_{-}\mathbf{n}), \operatorname{Set}(\mathbf{a}_{-}\mathbf{i}, \operatorname{forall} \mathbf{i}) \\ & \to \{a_n\}, \Big\{a_i \Big \forall i \Big\} \\ & \operatorname{Set}(\operatorname{vec}(1, \mathbf{n}), \operatorname{forall} \mathbf{n}) \\ & \to \left\{ \binom{1}{n} \middle \forall n \right\} \end{split}$	math set, use Set not set since the latter is a Typst keyword
evaluated(content)	eval	$\begin{array}{l} \operatorname{eval}(f(x)) _ 0 ^n \\ \to f(x) \big _0^\infty \\ \operatorname{eval}(f(x) / g(x)) _ 0 ^n \\ \to \frac{f(x)}{g(x)} \big _0^1 \end{array}$	attach a vertical bar on the right to denote evaluation boundaries
expectationvalue	expval	$\begin{array}{l} \text{expval(u)} \to \left\langle u \right\rangle \\ \text{expval(f/N)} \to \left\langle \frac{f}{N} \right\rangle \end{array}$	expectation value

3.2. Vector notations

Symbol	Abbr.	Example	Notes
typst vec ()		$\operatorname{vec}(1,2) \to \binom{1}{2}$	column vector
vecrow()		vecrow(alpha, b) $\rightarrow (\alpha, b)$	row vector
		vecrow(sum_0^n a_i, b) $\rightarrow \left(\sum_0^n a_i, b\right)$	
тт		$v^TT,\ A^TT\to v^T,A^T$	transpose, also see Section 3.7.2
vectorbold(content)	vb	vb(a),vb(mu_1) $ ightarrow a, \mu_1$	vector, bold
<pre>vectorunit(content)</pre>	vu	vu(a),vu(mu_1) $ ightarrow \hat{a},\hat{\mu}_1$	unit vector
vectorarrow(content)	va	${\rm va(a),va(mu_1)} \rightarrow \vec{a}, \vec{\mu}_1$	vector, arrow (not bold: see ISO 80000-2:2019)
gradient	grad	grad f $ ightarrow oldsymbol{ abla} f$	gradient
divergence	div	div vb(E) $ ightarrow oldsymbol{ abla} \cdot oldsymbol{E}$	divergence
curl		curl vb(B) $ ightarrow oldsymbol{ abla} imes oldsymbol{B}$	curl
laplacian		diaer(u) = c^2 laplacian u $\rightarrow \ddot{u} = c^2 \nabla^2 u$	Laplacian, different from $$^{\rm typst}$$ laplace Δ
dotproduct	dprod	a dprod b $ ightarrow a \cdot b$	dot product
crossproduct	cprod	a cprod b $\longrightarrow a \times b$	cross product
innerproduct	iprod	$\begin{array}{l} \mathrm{iprod}(\mathbf{u},\ \mathbf{v}) \longrightarrow \langle u,v \rangle \\ \mathrm{iprod}(\mathrm{sum_i}\ \mathrm{a_i},\ \mathrm{b}) \\ \longrightarrow \left\langle \sum_i a_i,b \right\rangle \end{array}$	inner product

3.3. Matrix notations

Symbol	Abbr.	Example	Notes
TT		$\mathbf{v}^{\smallfrown}\mathbf{TT}\text{, }\mathbf{A}^{\smallfrown}\mathbf{TT}\longrightarrow v^{T},A^{T}$	transpose, also see
			Section 3.7.2
typst mat()			matrix
<pre>matrixdet()</pre>	mdet	$mdet(1,x;1,y) \rightarrow \begin{vmatrix} 1 & x \\ 1 & y \end{vmatrix}$	matrix determinant
diagonalmatrix()	dmat	$\operatorname{dmat}(1,2) \to \begin{pmatrix} 1 \\ 2 \end{pmatrix}$	diagonal matrix
		<pre>dmat(1,a,xi,delim:"[",fill</pre>	:
		$ \begin{array}{c} 0) \\ \rightarrow \begin{bmatrix} 1 & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & \xi \end{bmatrix} \end{array} $	
<pre>antidiagonalmatrix()</pre>	admat	$\operatorname{admat}(1,2) \to \binom{1}{2}$	anti-diagonal matrix
		admat(1,a,xi,delim:"[",fil $ \rightarrow \begin{bmatrix} \cdot & \cdot & 1 \\ \cdot & a & \cdot \\ \xi & \cdot & \cdot \end{bmatrix} $	l:dot)
<pre>identitymatrix()</pre>	imat	$imat(2) \rightarrow \begin{pmatrix} 1 \\ 1 \end{pmatrix}$	identity matrix
		<pre>imat(3,delim:"[",fill:*)</pre>	

Jacobian matrix: jacobianmatrix(...), i.e. jmat(...).

 $Hessian \ matrix: \ hessian matrix(...), \ i.e. \ hmat(...).$

Matrix built with an element building function: xmatrix(m, n, func), i.e. xmat(...). The element building function func takes two integers which are the row and column numbers starting from 1.

3.4. Dirac braket notations

Symbol	Abbr.	Example	Notes
bra(content)		$bra(u) o \langle u $	bra
		$\operatorname{bra}(\operatorname{vec}(1,2)) \to \left\langle \begin{pmatrix} 1\\2 \end{pmatrix} \right $	
ket(content)		$ket(u) \to u\rangle$	ket
		$\ker(\operatorname{vec}(1,2)) \to \left \binom{1}{2} \right\rangle$	
expval(content)		expval(u) $\rightarrow \langle u \rangle$	expectation
		$\operatorname{expval}(\operatorname{vec}(1,2)) o \left\langle {1 \choose 2} \right\rangle$	
braket(a, b)		<pre>braket(a), braket(u, v)</pre>	braket
		$\rightarrow \langle a a\rangle, \langle u v\rangle $	
		$\operatorname{braket}(\operatorname{vec}(1,2),\ \operatorname{b}) o \left\langle {1 \choose 2} \middle b \right\rangle$	
ketbra(a, b)		ketbra(a), ketbra(u, v)	ketbra
		$ ightarrow a\rangle\langle a , u\rangle\langle v $ ketbra(vec(1,2), b) $ ightarrow \left \binom{1}{2}\right\rangle\left\langle b\right $	
	ma1	1 (2) / (1	
matrixelement(n, M, m)	mel	mel(n, diff_nu H, m) $\rightarrow \langle n \partial_{\nu}H m\rangle$	matrix element
		$mel(vec(U,V),A,m) o \left\langle \binom{U}{V} \middle A \middle m \right\rangle$	
		* * * * * * *	

3.5. Math functions

Typst built-in math operators: math.op.

Expressions		Results
sin(x), $sinh(x)$,	arcsin(x), asin(x)	$\sin(x), \sinh(x), \arcsin(x), \sin(x)$
cos(x), cosh(x),	arccos(x), acos(x)	$\cos(x), \cosh(x), \arccos(x), \cos(x)$
tan(x), $tanh(x)$,	<pre>arctan(x), atan(x)</pre>	$\tan(x), \tanh(x), \arctan(x), \tan(x)$
sec(x), sech(x),	arcsec(x), asec(x)	$\sec(x), \operatorname{sech}(x), \operatorname{arcsec}(x), \operatorname{asec}(x)$
csc(x), $csch(x)$,	arccsc(x), $acsc(x)$	$\csc(x), \operatorname{csch}(x), \operatorname{arccsc}(x), \operatorname{acsc}(x)$
cot(x), coth(x),	<pre>arccot(x), acot(x)</pre>	$\cot(x), \coth(x), \operatorname{arccot}(x), \operatorname{acot}(x)$
.	.	
Expressions	Results	Notes

Expressions	Results	Notes
typst Pr(x)	$\Pr(x)$	probability
^{typst} exp x	$\exp x$	exponential
typst log x, $lg x$, $ln x$	$\log x, \lg x, \ln x$	logarithmic
^{typst} det A	$\det A$	matrix determinant

diag(-1,1,1,1)	$\operatorname{diag}(-1,1,1,1)$	diagonal matrix, compact form (use dmat for the "real" matrix form)
trace A, tr A	$\operatorname{trace} A,\operatorname{tr} A$	matrix trace
Trace A, Tr A	$\operatorname{Trace} A,\operatorname{Tr} A$	matrix trace, alt.
rank A	$\operatorname{rank} A$	matrix rank
erf(x)	$\operatorname{erf}(x)$	Gauss error function
Res A	$\operatorname{Res} A$	residue (complex analysis)
Re z, Im z	${\rm Re}z, {\rm Im}z$	real, imaginary (complex analysis)
sgn x	$\operatorname{sgn} x$	sign function

3.6. Differentials and derivatives

Symbol	Abb	r.Example	Notes
<pre>differential()</pre>	dd	e.g. $\mathrm{d}f, \mathrm{d}x\mathrm{d}y, \mathrm{d}^3x, \mathrm{d}x \wedge \mathrm{d}y$ See Section 3.6.1	differential
variation()	var	$ extsf{var(f)} o \delta f$ $ extsf{var(x,y)} o \delta x \delta y$	variation, shorthand of dd(, d: delta)
difference()		$\begin{array}{l} \mathrm{difference(f)} \longrightarrow \Delta f \\ \mathrm{difference(x,y)} \longrightarrow \Delta x \Delta y \end{array}$	<pre>difference, shorthand of dd(, d: Delta)</pre>
derivative()	dv	e.g. $\frac{\mathrm{d}}{\mathrm{d}x}, \frac{\mathrm{d}f}{\mathrm{d}x}, \frac{\Delta^k f}{\Delta x^k}, \mathrm{d}f/\mathrm{d}x$ See Section 3.6.2	derivative
partialderivative()	pdv	e.g. $\frac{\partial}{\partial x}$, $\frac{\partial f}{\partial x}$, $\frac{\partial^4 f}{\partial x^2 \partial y^2}$, $\frac{\partial^5 f}{\partial x^2 \partial y^3}$, $\frac{\partial f}{\partial x}$ See Section 3.6.3	partial derivative, could be mixed order

3.6.1. Differentials

Functions: differential(*args, **kwargs), abbreviated as dd(...).

- positional *args*: the variable names, then at the last **optionally** followed by an order number e.g. 2, or an order array e.g. [2,3], [k], [m n, lambda+1].
- named *kwargs*:
 - d: the differential symbol [default: upright(d)].
 - p: the product symbol connecting the components [default: none].

Order assignment algorithm:

- If there is no order number or order array, all variables has order 1.
- If there is an order number (not an array), then this order number is assigned to *every* variable, e.g. dd(x,y,2) assigns $x \leftarrow 2, y \leftarrow 2$.
- If there is an order array, then the orders therein are assigned to the variables in order, e.g. dd(f,x,y,[2,3]) assigns $x \leftarrow 2, y \leftarrow 3$.
- If the order array holds fewer elements than the number of variables, then the orders of the remaining variables are 1, e.g. dd(x,y,z,[2,3]) assigns $x \leftarrow 2, y \leftarrow 3, z \leftarrow 1$.
- If a variable x has order 1, it is rendered as dx not $d^{1}x$.

Examples

(1)
$$dd(f)$$
, $dd(x,y)$ (2) $dd(x,3)$, $dd(f,[k])$, $dd(f,[k],d:delta)$
$$d^3x, d^kf, \delta^kf$$

(3)
$$dd(f,2)$$
, $dd(vb(x),t,[3,])$ (4) $dd(x,y,[2,3])$, $dd(x,y,z,[2,3])$
$$d^2f,d^3xdt$$

$$d^2xd^3y,d^2xd^3ydz$$
 (5) $dd(x,y,z,[1,1],rho+1,n_1])$ (6) $dd(x,y,d)$ Delta), $dd(x,y,z,d)$ Delta)
$$d^{[1,1]}xd^{\rho+1}yd^{n_1}z$$

$$\Delta x\Delta y, \Delta^2x\Delta^2y$$
 (7) $dd(t,x_1,x_2,x_3,p)$ and) (7) $dd(t,x_1,x_2,x_3,d)$ Upright(D))
$$dt \wedge dx_1 \wedge dx_2 \wedge dx_3$$

$$DtDx_1Dx_2Dx_3$$

3.6.2. Ordinary derivatives

Function: derivative(f, *args, **kwargs), abbreviated as dv(...).

- f: the function, which can be #none or omitted,
- positional args: the variable name, then at the last optionally followed by an order number e.g. 2,
- named kwargs:
 - d: the differential symbol [default: upright(d)].
 - s: the "slash" separating the numerator and denominator [default: none], by default it produces the normal fraction form $\frac{df}{dx}$. The most common non-default is slash or simply \/, so as to create a flat form df/dx that fits inline.

Order assignment algorithm: there is just one variable, so the assignment is trivial: simply assign the order number (default to 1) to the variable. If a variable x has order 1, it is rendered as x not x^1 .

Examples

(1)
$$\text{dv}(,x)$$
, $\text{dv}(,x,2)$, $\text{dv}(f,x,k+1)$ (2) $\text{dv}(,\text{vb}(r))$, $\text{dv}(f,\text{vb}(r)_e, 2)$
$$\frac{\text{d}}{\text{d}x}, \frac{\text{d}^2}{\text{d}x^2}, \frac{\text{d}^{k+1}f}{\text{d}x^{k+1}}$$

$$\frac{\text{d}}{\text{d}r}, \frac{\text{d}^2}{\text{d}r_e^2}$$
 (3) $\text{dv}(f,x,2,s:\/)$, $\text{dv}(f,xi,k+1,s:slash)$ (4) $\text{dv}(,x,d:delta)$, $\text{dv}(,x,2,d:Delta)$
$$\frac{\delta}{\delta x}, \frac{\Delta^2}{\Delta x^2}$$
 (5) $\text{dv}(\text{vb}(u),t,2,d:upright(D))$ (6) $\text{dv}(\text{vb}(u),t,2,d:upright(D),s:slash)}$
$$\frac{D^2 u}{Dt^2}$$

3.6.3. Partial derivatives (incl. mixed orders)

Function: partialderivative(f, *args, **kwargs), abbreviated as pdv(...).

- f: the function, which can be #none or omitted,
- positional *args*: the variable names, then at last **optionally** followed by an order number e.g. 2, or an order array e.g. [2,3], [k], [m n, lambda+1].
- named *kwargs*:
 - s: the "slash" separating the numerator and denominator [default: none], by default it produces the normal fraction form $\frac{\partial f}{\partial x}$. The most common non-default is slash or simply \/, so as to create a flat form $\partial f/\partial x$ that fits inline.
 - total: the user-specified total order.

• If it is absent, then (1) if the orders assigned to all variables are numeric, the total order number will be **automatically computed**; (2) if non-number symbols are present, computation will be attempted with minimum effort, and a user override with argument total may be necessary.

Order assignment algorithm:

- If there is no order number or order array, all variables has order 1.
- If there is an order number (not an array), then this order number is assigned to *every* variable, e.g. pdv(f,x,y,2) assigns $x \leftarrow 2, y \leftarrow 2$.
- If there is an order array, then the orders therein are assigned to the variables in order, e.g. pdv(f,x,y,[2,3]) assigns $x \leftarrow 2, y \leftarrow 3$.
- If the order array holds fewer elements than the number of variables, then the orders of the remaining variables are 1, e.g. pdv(f,x,y,z,[2,3]) assigns $x \leftarrow 2, y \leftarrow 3, z \leftarrow 1$.
- If a variable x has order 1, it is rendered as x, not x^1 .

Examples

$$(1) \operatorname{pdv}(,\mathsf{x}), \operatorname{pdv}(,\mathsf{t},2), \operatorname{pdv}(,\operatorname{lambda},[\mathsf{k}]) \qquad (2) \operatorname{pdv}(\mathsf{f},\mathsf{vb}(\mathsf{r})), \operatorname{pdv}(\mathsf{phi},\mathsf{vb}(\mathsf{r})_{-e},2) \\ \frac{\partial}{\partial x}, \frac{\partial^2}{\partial t^2}, \frac{\partial^k}{\partial \lambda^k} \qquad \qquad \frac{\partial \varphi}{\partial r}, \frac{\partial^2 \varphi}{\partial r_e^2} \\ (3) \operatorname{pdv}(,\mathsf{x},\mathsf{y}), \operatorname{pdv}(,\mathsf{x},\mathsf{y},2) \qquad \qquad (4) \operatorname{pdv}(\mathsf{f},\mathsf{x},\mathsf{y},2), \operatorname{pdv}(\mathsf{f},\mathsf{x},\mathsf{y},3) \\ \frac{\partial^2}{\partial x \partial y}, \frac{\partial^4}{\partial x^2 \partial y^2} \qquad \qquad \frac{\partial^4 \varphi}{\partial x^2 \partial y^2}, \frac{\partial^6 \varphi}{\partial x^3 \partial y^3} \\ (5) \operatorname{pdv}(,\mathsf{x},\mathsf{y},[2,]), \operatorname{pdv}(,\mathsf{x},\mathsf{y},[1,2]) \qquad \qquad (6) \operatorname{pdv}(,\mathsf{t},2,\mathsf{s};\backslash), \operatorname{pdv}(\mathsf{f},\mathsf{x},\mathsf{y},\mathsf{s};\mathsf{slash}) \\ \frac{\partial^3}{\partial x^2 \partial y}, \frac{\partial^3}{\partial x \partial y^2} \qquad \qquad (8) \operatorname{pdv}(\operatorname{phi},\mathsf{x},\mathsf{y},\mathsf{z},\mathsf{tau}, [2,2,2,1]) \\ \frac{\partial^5}{\partial (x^1) \partial (x^2)^3 \partial (x^3)} \qquad \qquad (9) \operatorname{pdv}(,\mathsf{x},\mathsf{y},\mathsf{z},\mathsf{t},[1,\mathsf{xi},2,\mathsf{eta+2}]) \qquad \qquad (10) \operatorname{pdv}(,\mathsf{x},\mathsf{y},\mathsf{z},[\mathsf{xi},\mathsf{n},\mathsf{n}-1],\mathsf{total};(\mathsf{xi}+1)\mathsf{n}) \\ \frac{\partial^{\eta+\xi+5}}{\partial x \partial y^\xi \partial z^2 \partial t^{\eta+2}} \qquad \qquad \frac{\partial^{(\xi+1)n}}{\partial x^{\xi n} \partial y^{n-1} \partial z}$$

3.7. Miscellaneous

3.7.1. Reduced Planck constant (hbar)

In the default font, the Typst built-in symbol planck. reduce \hbar looks a bit off: on letter "h" there is a slash instead of a horizontal bar, contrary to the symbol's colloquial name "h-bar". This package offers hbar to render the symbol in the familiar form: \hbar . Contrast:

(11) integral_V dd(V) (pdv(cal(L), phi) - diff_mu (pdv(cal(L), (diff_mu phi)))) = 0

 $\int_{V} dV \left(\frac{\partial \mathcal{L}}{\partial \varphi} - \partial_{\mu} \left(\frac{\partial \mathcal{L}}{\partial (\partial_{\mu} \varphi)} \right) \right) = 0$

Typst's planck.reduce
$$E=\hbar\omega$$
 $\frac{\pi G^2}{\hbar c^4}$ $Ae^{\frac{i(px-Et)}{\hbar}}$ $i\hbar\frac{\partial}{\partial t}\psi=-\frac{\hbar^2}{2m}\nabla^2\psi$ this package's hbar $E=\hbar\omega$ $\frac{\pi G^2}{\hbar c^4}$ $Ae^{\frac{i(px-Et)}{\hbar}}$ $i\hbar\frac{\partial}{\partial t}\psi=-\frac{\hbar^2}{2m}\nabla^2\psi$

3.7.2. Matrix transpose

Matrix transposition can be simply written as ..^T, just like handwriting, and the T will be formatted properly to represent transposition instead of a normal letter T. This conversion is disabled if the base is an integral symbol. As a fallback, this package also provides symbol TT to represent the transpose: A^TT.

To enable this feature, users need to first import this and call

```
#import "...(this physica package)...": super-T-as-transpose
#show: super-T-as-transpose
```

If you'd like to only apply this show rule within a scope, you may do

```
#import "...(this physica package)...": super-T-as-transpose
#[
    #show: super-T-as-transpose
    ... // Only enabled inside this #[..] scope.
]
```

Examples

(1)
$$(A_n B_n)^T = B_n^T A_n^T$$
 (2) integral_0^T A^T $f(x)$ dif x
$$(A_n B_n)^T = B_n^T A_n^T$$

$$\int_0^T A^T f(x) dx$$

3.7.3. Tensors

Tensors are often expressed using the <u>abstract index notation</u>, which makes the contravariant and covariant "slots" explicit. The intuitive solution of using superscripts and subscripts do not suffice if both upper (contravariant) and lower (covariant) indices exist, because the notation rules require the indices be vertically separated: e.g. T_b^a and T_a^b , which are of different shapes. " T_b^a " is flatly wrong, and T^(space w)_(i space j) produces a weird-looking " T_i^w " (note w, j vertically overlap).

Function: tensor(symbol, *args).

- *symbol*: the tensor symbol,
- positional *args*: each argument takes the form of +... or -..., where a + prefix denotes an upper index and a prefix denotes a lower index.

Examples

$$(1) \ {\rm tensor}({\rm u}, {\rm +a}) \ , \ {\rm tensor}({\rm v}, {\rm -a}) \ \\ u^a, v_a \ \\ (3) \ {\rm tensor}({\rm T}, {\rm +a}, {\rm -b}) \ , \ {\rm tensor}({\rm T}, {\rm -a}, {\rm +b}) \ \\ T^a_b, T^b_a \ \\ (5) \ {\rm tensor}(({\rm dd}({\rm x^{\ lambda}})) \ , {\rm -a}) \ \\ (2) \ {\rm tensor}({\rm h}, {\rm +mu}, {\rm +nu}) \ , \ {\rm tensor}({\rm g}, {\rm -mu}, {\rm -nu}) \ \\ h^{\mu\nu}, g_{\mu\nu} \ \\ (4) \ {\rm tensor}({\rm T}, -{\rm i}, +{\rm w}, -{\rm j}) \ \\ T^w_{i \ j} \ \\ (5) \ {\rm tensor}(({\rm dd}({\rm x^{\ lambda}})) \ , {\rm -a}) \ \\ (6) \ {\rm tensor}({\rm AA}, {\rm +a}, {\rm +b}, {\rm -c}, {\rm -d}, {\rm +e}, {\rm -f}, {\rm +g}, {\rm -h}) \ \\ (6) \ {\rm tensor}({\rm AA}, {\rm +a}, {\rm +b}, {\rm -c}, {\rm -d}, {\rm +e}, {\rm -f}, {\rm +g}, {\rm -h}) \ \\ (6) \ {\rm tensor}({\rm AA}, {\rm +a}, {\rm +b}, {\rm -c}, {\rm -d}, {\rm +e}, {\rm -f}, {\rm +g}, {\rm -h}) \ \\ (6) \ {\rm tensor}({\rm AA}, {\rm +a}, {\rm +b}, {\rm -c}, {\rm -d}, {\rm +e}, {\rm -f}, {\rm +g}, {\rm -h}) \ \\ (6) \ {\rm tensor}({\rm AA}, {\rm +a}, {\rm +b}, {\rm -c}, {\rm -d}, {\rm +e}, {\rm -f}, {\rm +g}, {\rm -h}) \ \\ (6) \ {\rm tensor}({\rm AA}, {\rm +a}, {\rm +b}, {\rm -c}, {\rm -d}, {\rm +e}, {\rm -f}, {\rm +g}, {\rm -h}) \ \\ (6) \ {\rm tensor}({\rm AA}, {\rm +a}, {\rm +b}, {\rm -c}, {\rm -d}, {\rm +e}, {\rm -f}, {\rm +g}, {\rm -h}) \ \\ (8) \ {\rm tensor}({\rm AA}, {\rm +a}, {\rm +b}, {\rm -c}, {\rm -d}, {\rm +e}, {\rm -f}, {\rm -g}, {\rm -h}) \ \\ (8) \ {\rm tensor}({\rm AA}, {\rm -a}, {\rm -b}, {\rm -c}, {\rm -d}, {\rm -e}, {\rm -d}, {\rm -e}, {\rm -e$$

(9) grad mu A^nu = diff mu A^nu + tensor(Gamma, +nu, -mu, -lambda) A^lambda

$$\nabla_{\mu}A^{\nu} = \partial_{\mu}A^{\nu} + \Gamma^{\nu}_{\ \mu\lambda}A^{\lambda}$$

3.7.4. Isotopes

Function: isotope (element, a: ..., z: ...).

- *element*: the chemical element (use ".." for multi-letter symbols)
- *a*: the mass number *A* [default: none].
- *z*: the atomic number *Z* [default: none].

Change log: Typst merged my PR, which fixed a misalignment issue with the surrounding text.

Examples

3.7.5. The n-th term in Taylor series

Function: taylorterm(func, x, x0, idx).

- *func*: the function e.g. f, (f+g),
- x: the variable name e.g. x,
- x0: the variable value at the expansion point e.g. x_0 , (1+a),
- *idx*: the index of the term, e.g. 0, 1, 2, n, (n+1).

If x0 or idx is in a parenthesis e.g. (1+k), then the function automatically removes the outer parenthesis where appropriate.

Examples

$$rac{F^{(n)}(x_0^
u)}{n!}(x^
u-x_0^
u)^n$$

$$\frac{f_p^{(n+1)}(x_0)}{(n+1)!}(x-x_0)^{n+1}$$

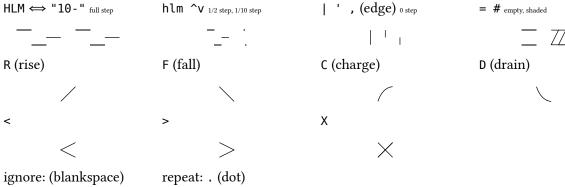

3.7.6. Signal sequences (digital timing diagrams)

In engineering, people often need to draw digital timing diagrams for signals, like . . .

Function: signals(str, step::..., style:...).

- str: a string representing the signals. Each character represents an glyph (see below).
- step (optional): step width, i.e. how wide each glyph is [default: #1em].
- color (optional): the stroke color [default: #black].

Glyph characters

separate: &

Examples

(1) signals("10.1"), signals("1|0|1|0R"), signals("CD"), signals("CD", step: #2em)

(2) signals($"M'H|L|h|l|^|v,&|H'M'H|l,m,l|"$) (the ampersand & serves as a separator)

(3) signals("-|=|-", step: #2em), signals("-|#|-"), signals("-<=>-<=")

(4) signals("R1..F0..", step: #.5em)signals("R1.|v|1", step: #.5em, color:#fuchsia)

(5)

3.8. Symbolic addition

This package implements a very rudimentary, bare-minimum-effort symbolic addition function to aid the automatic computation of a partial derivative's total order in the absence of user override (see Section 3.6.3). Though rudimentary and unsophisticated, this should suffice for most use cases in partial derivatives.

Function: BMEsymadd([...]).

• ...: symbols that need to be added up e.g. [1,2], $[a+1,b^2+1,2]$.

Examples

(1) BMEsymadd([1]), BMEsymadd([2, 3])	\rightarrow	1,5
(2) BMEsymadd([a, b^2, 1])	\rightarrow	$a + b^2 + 1$
(3) BMEsymadd([a+1,2c,b,2,b])	\rightarrow	a + 2b + 2c + 3
(4) BMEsymadd([a+1,2(b+1),1,b+1,15])	\rightarrow	a + b + 2(b+1) + 18
(5) BMEsymadd([a+1,2(b+1),1,(b+1),15])	\rightarrow	a+3(b+1)+17
(6) BMEsymadd([a+1,2(b+1),1,3(b+1),15])	\rightarrow	a + 5(b+1) + 17
(7) BMEsymadd([2a+1,xi,b+1,a xi + 2b+a,2b+1])	\rightarrow	$a\xi + 3a + 5b + \xi + 3$

4. Acknowledgement

Huge thanks to these LATEX packages, for lighting the way of physics typesetting.
